John Claesquin

APPLICANTS

TIME

Method: A total of 1000 patients with a confirmed diagnosis of COVID-19 were included in the study. The patients were divided into two groups: the control group (n=500) and the intervention group (n=500). The control group received standard care, while the intervention group received a combination of standard care and a new treatment protocol. The primary outcome was the mortality rate, and the secondary outcome was the length of hospital stay. The data were analyzed using a logistic regression model.
